How to choose a coolant type for a battery pack cooling system?

Confirm the coolant type based on the application environment and temperature range. The total number of radiators used in the battery pack cooling system and the sum of their heat dissipation capacity are the minimum requirements for the coolant circulation system.

How to design a power lithium battery thermal management system?

There are two design goals for the thermal management system of the power lithium battery: 1) Keep the inside of the battery pack within a reasonable temperature range; 2) Ensure that the temperature difference between different cells is as small as possible. In the design of a project, the first step must be to clarify the customer's needs.

How to choose a cooling system?

The overall design, according to the input requirements, generally considers the frame of the cooling system. According to the system heating power density and sealing, allowable temperature range, cost requirements, etc., select a suitable cooling method, and preliminarily determine the type of radiator and heating method.

What happens if the battery pack temperature is too low?

When the temperature of the battery pack is too low,the battery pack is not allowed to discharge,and the vehicle owner is required to turn on the external power supply to supply power to the heating system in the battery pack,and the vehicle is in a prohibited state.

What are the types of components in a battery pack?

The types of components in the battery pack generally include cells, high and low voltage wires, structural components for fixing cells, radiators for cooling systems, cooling system pipelines, battery boxes, battery management systems BMS, and sensors. The following table is a general classification of the materials in the box by the case authors.
