

How does a small cell base station communicate with a core network?

The small cell base station communicates with the core network over a high-speed backhaul connection. Core network: The core network manages the overall operation of the small cell network, including authentication, authorization, and routing of user traffic.

What is a compact base station?

These compact cells possess all the essential features of traditional base stations (BSs) but offer a higher data rate for individual subscribers. They were introduced in 3GPP Release 9 specifications. Small cells are crucial for high-speed broadband and low-latency applications in LTE-Advanced and 5G NR deployments.

What are the functions of a small cell base station?

It includes various functions such as the User Plane Function (UPF), Control Plane Function (CPF), and Session Management Function (SMF). Transport network: The transport network provides the high-speed connectivity between the small cell base station and the core network.

What is a base station in a cellular telephone network?

Base stations in cellular telephone networks are more commonly referred to as cell towers. Each cellphone connects to the cell tower, which in turn connects it to the wired public switched telephone network (PSTN), the internet or to other cellphones within the cell.

What's the difference between a macro base station and a small cell?

With a macro base station, there's one pipe going into the network; with small cells, it breaks the pipe into many pipes. The main goal of small cells is to increase the macro cell's edge data capacity, speed and overall network efficiency.

How does a base station communicate with a client device?

Generally, if client devices wanted to communicate to each other, they would communicate both directly with the base station and do so by routing all traffic through it for transmission to another device. Base stations in cellular telephone networks are more commonly referred to as cell towers.
