

Why should you use an anti-backflow solution for energy storage systems?

During the discharge process of industrial and commercial energy storage systems, due to power fluctuations, changes in load power consumption and other reasons, reverse flow of electrical energy may also occur. The anti-backflow solution can effectively avoid this problem and ensure the safe and efficient operation of the energy storage system.

What is a photovoltaic system with anti-backflow?

After installing a photovoltaic system with anti-backflow, the power generated by the photovoltaic is only supplied to the local load, and the power generated by the photovoltaic energy storage system can be controlled not to be sent to the grid.

Does energy storage have a backflow problem?

As the scale of global industrial and commercial electricity consumption continues to expand, industrial and commercial energy storage technology has attracted more and more attention. The backflow problem in energy storage systems has always been a problem that troubles users.

What is backflow prevention?

Preventing the occurrence of backflow problems is called backflow prevention. In order to prevent backflow problems, anti-backflow devices came into being.

Why should I install an anti-backflow prevention solution?

There are several reasons for installing an anti-backflow prevention solution: 2.1. Limited by the capacity of the upper-level transformer, users have new grid system installation needs, but it is not allowed locally. 2.2. Due to some regional policies, grid connection is not allowed. Once it is found, the grid company will impose a fine.

How does a Deye inverter anti-backflow work?

4. The solution? Deye inverter anti-backflow working principle: install a meter with CT or current sensor at the grid-connected point. When it detects that there is current flowing to the grid, it will feed back to the inverter, and the inverter will immediately change its working mode and track from the maximum power point of MPPT.
