

Their wettability and permeability influence cell efficiency since a highly wettable and permeable material leads to high electrolyte saturation and reduced pumping losses. A higher saturation ...

This study aims to find beneficial effects on the saturation of a VRFB electrode by visualizing electrolyte wetting and quantifying saturation and pressure drop via injection of ...

The results indicate how the filling process, the final electrolyte saturation, and also the battery performance can be optimized by adapting ...

Spatial separation of the electrolyte and electrode is the main characteristic of flow-battery technologies, which liberates them from the constraints of overall energy content and ...

Herein, a particle-bonded catalyst-modified electrode was proposed from the insight into interface behaviors of flow batteries, matching the ...

The electrolyte distribution inside the porous electrodes of vanadium redox flow batteries is critical to the performance, as it determines the electrochemically active surface area.

The performance of flow batteries is critically influenced by mass, ion, and electron transport processes and electrochemical reactions within the heterogenous porous electrodes. ...

The electrolyte distribution inside the porous electrodes of vanadium redox flow batteries is critical to the performance, as it determines ...

They observed a lack of electrolyte supply in the central region of the porous electrode. This non-uniform electrolyte saturation characteristic can be explained by the ...

The results indicate how the filling process, the final electrolyte saturation, and also the battery performance can be optimized by adapting process parameters as well as electrode and ...

In a battery without bulk flow of the electrolyte, the electro-active material is stored internally in the electrodes. However, for flow batteries, the energy component is dissolved in the electrolyte itself.

To investigate the effects of gas evolution on liquid flow under constant pressure difference conditions, we propose a gravity-driven electrolyte feeding system for testing in a ...

Nevertheless, in a fixed-electrode CDI cell, because the amounts of active electrodes are limited by the size of

the current collector, the deionization capacity of the CDI ...

Each half-cell contains an electrode and an electrolyte. Positive half-cell: cathode and catholyte. Negative half-cell: anode and anolyte. Redox reactions occur in each half-cell to produce or ...

Abstract Flow batteries with flow-through porous electrodes are compared to cells with porous electrodes adjacent to either parallel or interdigitated channels. Resistances and ...
