

Are static lithium-bromide batteries a viable energy storage technology?

Despite their potential as conversion-type energy storage technologies, the performance of static lithium-bromide (SLB) batteries has remained stagnant for decades. Progress has been hindered by the intrinsic liquid-liquid redox mode and single-electron transfer of these batteries.

What is the energy storage density of lithium bromide?

Chemically stable composites with >32 wt% of lithium bromide have been synthesized. The energy storage densities of the 4 composites show their relevance for residential applications. High energy storage density up to 381 kWh/m³ was measured for silica gel/LiBr 53 wt%.

What is a catalyst-free lithium-bromine rechargeable fuel cell?

In this paper, we describe a high efficiency catalyst-free lithium-bromine rechargeable fuel cell using highly concentrated bromine catholytes, with higher theoretical energy density than most lithium-ion cathode materials and catalyst-free lithium-air chemistries.

Can high energy lithium bromine flow batteries be a power source?

High energy lithium bromine flow batteries can potentially be the ultimate solutions as a power source of long-range electrified transportation and grid-level energy storage. In this work, we build on the architecture first developed by Bai and Bazant 54 and overcome some of the key limitations in the original design.

What is the peak power of lithium bromine chemistries?

Chang et al. 64 explored lithium bromine chemistries with moderate concentration catholyte of up to 7 M LiBr/1 M Br₂ which provided a peak power of 29.67 mW cm⁻² at a voltage of ~ 2.5 V. While they claim to have achieved an energy density of 1220 Wh kg⁻¹, they include the contribution of active lithium metal (3862 mAh g⁻¹).

What is the redox potential of lithium and bromine?

Lithium when paired with bromine manages to overcome the reaction limitations of zinc and can deliver up to ~ 1300 Wh l⁻¹ (based on a peak LiBr solubility of 12 M in water) under theoretical conditions at a redox potential of 4.08 V.
