How will the vanadium market change in 2025?

patpitchaya / Shutterstock The vanadium market is set to shift in 2025, driven by demand from the energy storage and steel sectors. Energy storage systems that utilize vanadium redox flow batteries (VRFBs) are gaining traction as renewable energy deployment accelerates, boosting demand for high-purity vanadium.

Are vanadium redox flow batteries the future of energy storage?

Energy storage systems that utilize vanadium redox flow batteries (VRFBs) are gaining traction as renewable energy deployment accelerates, boosting demand for high-purity vanadium. However, global supply remains constrained due to limited mining projects and geopolitical uncertainties, particularly in China and Russia, key producers.

Is steel really 90 percent of vanadium demand?

"No, no, no, no, absolutely not. If you want to look worldwide, you can say that steel in general is something like 90 percent (of vanadium demand)," Sardain said in a December interview with INN. The expert went on to point out that quantifying the amount of vanadium used in batteries and energy storage is challenging.

Does reselling vanadium electrolyte preserve its operative value?

In addition, the vanadium electrolyte after regeneration preserves its operative value because it is not affected by cross-contamination and aging effects. However, no market quotations are available at present for vanadium reselling, so that in a prudential analysis it was assumed EOL cost equal to zero, consistently with most literature [13,23].

Why is vanadium demand rising?

"Vanadium demand in batteries is estimated to rise rapidly; this rise in demand will primarily come from China due to targeted government policies towards VRFBs," he told the Investing News Network (INN). China, which is the leading producer of vanadium, is also expected to drive global demand in the year ahead.

What if China becomes import reliant for vanadium?

"This also means that should China become import reliant for a meaningful share of vanadium, which is to be used in two significant national industries (steel and energy storage), vanadium will move up in criticality matrices for China-- moving nearer to materials like iron ore, potash and high-purity quartz."
