What is an off-grid inverter?

Off-Grid Inverter. Generally speaking, a solar inverter is a type of electrical converter that converts the variable direct current (DC) output of a solar panel into a utility frequency alternating current (AC) that can be fed into a commercial electrical grid or used by a local, off-grid electrical network.

What is an off-grid Solar System?

An off-grid solar system, also known as off-the-grid or standalone, is a photovoltaic system that has no access to the utility grid. For this reason, off-grid solar systems involve both solar panels and battery storage, so the power can be coming to the building from either of these two sources at any given time -- depending on the solar situation.

Why should you choose an off-grid Solar System?

The reason why this is advantageous is the fact that with no access to the utility grid, off-grid solar systems can be cheaper than extending power lines in certain remote areas. Moreover, living off the grid makes a solar system self-sufficient, and that can be a bonus for a lot of people.

What happens if a solar inverter fails?

Inverters have a much shorter lifespan than solar panels, charge controllers, or battery storage systems and will thus fail first during the system's operational life. A single inverter in the system will result in the entire system going out of operation when the inverter fails.

How many solar inverters do I Need?

Having two or more inverters linked and managed centrally is better than having one large output inverter running below 50% power load. Solar inverters operate best when the AC-load draw on each inverter is between sixty to eighty percent of the maximum rated inverter power output.

Does living off the grid make a solar system self-sufficient?

Moreover, living off the grid makes a solar system self-sufficient, and that can be a bonus for a lot of people. For these people, this feeling of self-sufficiency is worth more than saving money. Energy self-sufficiency is also a form of security.
